#### 4.5-DISUBSTITUTED-2-AMINOPYRIMIDINES

5 This invention relates to certain 4,5-disubstituted-2-aminopyrimidines, to processes for their preparation, to pharmaceutical compositions containing them, and to their use in medicine.

10 Angiogenesis, the growth of capillaries from existing blood vessels, is an essential process in normal embryonic development, tissue repair and some aspects of female reproductive function. It is also associated with the development of several pathological disorders including solid tumour growth, metastasis, psoriasis and rheumatoid arthritis, as well as diabetic retinopathy and age related macular degeneration (Folkman, *Nature Medicine*, (1995) 1, 27-310).

15 20 Several growth factors have been shown to mediate angiogenesis through alteration of vascular permeability, including vascular endothelial growth factor (VEGF; G. Breier *et al.*, *Trends in Cell Biology*, 1996, 6, 454-6), platelet derived growth factor (PDGF) and acidic and basic fibroblast growth factors (a & b FGF).

25 30 VEGF in dimeric form is a ligand that binds to two transmembrane tyrosine kinase associated receptors, expressed exclusively on proliferating endothelial cells, KDR (Flk-1 in mice) also known as VEGFR-2, and Flt-1 also known as VEGFR-1. Binding of VEGF to KDR/Flk and Flt leads to receptor dimerisation, kinase activation, autophosphorylation of the receptor and phosphorylation of intracellular substrates. An analogous series of events ensues after ligand occupancy of the more widely expressed tyrosine kinase associated FGFr receptor by aFGF or bFGF. Thus receptor tyrosine kinase activity initiates a cellular signalling pathway leading to proliferation.

35 Antagonism of VEGF with antibody completely suppresses neovascularisation and growth of human rhabdomyosarcoma A673 speroids in athymic mice (Borgstrom *et al.*, *Cancer Res.*, 1996, 56 4032-4039). Suppression of bFGF gene expression by interferons  $\alpha$  and  $\beta$

inhibits capillary density in mice, leading to pancreatic eyelet tumour suppression (Folkman *et al*, Proc. Natl. Acad. Sci. 1996, 93, 2002 and Singh *et al* Proc. Natl. Acad. Sci. 1995, 92, 10457). Other receptor associated kinases such as PDGF $\beta$  and EGFr may also have some role in 5 mediating angiogenesis.

We have now found certain 4,5-disubstituted-2-aminopyrimidines which are potent and selective inhibitors of receptor tyrosine kinases involved in angiogenesis, especially KDR kinase and/or FGFr kinase. Selective 10 inhibition of these kinases can be expected to have a beneficial effect and the compounds are thus of use in the prophylaxis and treatment of disease states associated with angiogenesis, as described hereinafter.

Thus, according to one aspect of the invention, we provide a compound of 15 formula (1):

wherein R<sup>1</sup> is a -XR<sup>6</sup> group [where X is a covalent bond, -O-, -S-, -C(O)-, 20 -C(S)-, -C(O)O-, -S(O)-, -S(O<sub>2</sub>)-, -CH<sub>2</sub>-, -or N(R<sup>7</sup>)- [where R<sup>7</sup> is a hydrogen atom or a straight or branched alkyl group] and R<sup>6</sup> is a hydrogen or halogen atom or an optionally substituted aliphatic, cycloaliphatic, heteroaliphatic, heterocycloaliphatic, aromatic or heteroaromatic group, or a -NO<sub>2</sub>, -CN, -SO<sub>2</sub>N(R<sup>8</sup>)(R<sup>9</sup>) [where R<sup>8</sup> and R<sup>9</sup>, which may be the same 25 or different is a hydrogen atom or an optionally substituted aliphatic, cycloaliphatic, heteroaliphatic, heterocycloaliphatic, aromatic or heteroaromatic group], -CON(R<sup>8</sup>)(R<sup>9</sup>), -CSN(R<sup>8</sup>)(R<sup>9</sup>), -NH<sub>2</sub> or substituted amino group;

-CONHR<sup>19</sup>, -CSNHR<sup>19</sup>, -CON[R<sup>19</sup>]<sub>2</sub>, -CSN[R<sup>19</sup>]<sub>2</sub>, -N(R<sup>14</sup>)SO<sub>2</sub>H [where R<sup>14</sup> is as defined above], -N(R<sup>14</sup>)SO<sub>2</sub>R<sup>19</sup>, -N[SO<sub>2</sub>R<sup>19</sup>]<sub>2</sub>, -N(R<sup>14</sup>)SO<sub>2</sub>NH<sub>2</sub>, -N(R<sup>14</sup>)SO<sub>2</sub>NHR<sup>19</sup>, -N(R<sup>14</sup>)SO<sub>2</sub>N[R<sup>19</sup>]<sub>2</sub>, -N(R<sup>14</sup>)COR<sup>19</sup>, -N(R<sup>14</sup>)CONH<sub>2</sub>, -N(R<sup>14</sup>)CONHR<sup>19</sup>, -N(R<sup>14</sup>)CON[R<sup>19</sup>]<sub>2</sub>, -N(R<sup>14</sup>)CSR<sup>19</sup>, -N(R<sup>14</sup>)CSNH<sub>2</sub>,

5 -N(R<sup>14</sup>)CSNHR<sup>19</sup>, -N(R<sup>14</sup>)CSN[R<sup>19</sup>]<sub>2</sub>, -N(R<sup>14</sup>)C(O)OR<sup>19</sup>, or an optionally substituted cycloaliphatic, heterocycloaliphatic, aryl or heteroaryl group; Alk is a straight or branched C<sub>1-6</sub> alkylene, C<sub>2-6</sub> alkenylene or C<sub>2-6</sub> alkynylene chain, optionally interrupted by one, two or three -O- or -S-atoms or S(O)-, -S(O)<sub>2</sub>- or -N(R<sup>14</sup>)- groups; and m is zero or an integer 1,

10 2 or 3.

When in the group -Alk(R<sup>18</sup>)<sub>m</sub> m is an integer 1, 2 or 3, it is to be understood that the substituent or substituents R<sup>18</sup> may be present on any suitable carbon atom in -Alk. Where more than one R<sup>18</sup> substituent is present these may be the same or different and may be present on the same or different atom in -Alk or in R<sup>17</sup> as appropriate. Thus for example, R<sup>17</sup> may represent a -CH(R<sup>18</sup>)<sub>2</sub> group, such as a -CH(OH)Ar group where Ar is an aryl or heteroaryl group as defined below. Clearly, when m is zero and no substituent R<sup>18</sup> is present the alkylene, alkenylene or alkynylene chain represented by Alk becomes an alkyl, alkenyl or alkynyl group.

When R<sup>18</sup> is a halogen atom it may be for example a fluorine, chlorine, bromine, or iodine atom.

25 Esterified carboxyl groups represented by the group R<sup>18</sup> include groups of formula -CO<sub>2</sub>Alk<sup>1</sup> wherein Alk<sup>1</sup> is a straight or branched, optionally substituted C<sub>1-8</sub> alkyl group such as a methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, s-butyl or t-butyl group; a C<sub>6-12</sub>arylC<sub>1-8</sub>alkyl group such as an optionally substituted benzyl, phenylethyl, phenylpropyl, 1-naphthylmethyl or 2-naphthylmethyl group; a C<sub>6-12</sub>aryl group such as an optionally substituted phenyl, 1-naphthyl or 2-naphthyl group; a C<sub>6-12</sub>aryloxyC<sub>1-8</sub>alkyl group such as an optionally substituted phenoxyethyl, phenoxyethyl, 1-naphthoxyethyl, or 2-naphthoxyethyl group; an optionally substituted C<sub>1-8</sub>alkanoyloxyC<sub>1-8</sub>alkyl group, such as a pivaloyloxyethyl, propionyloxyethyl or propionyloxypropyl group; or a C<sub>6-12</sub>aroyloxyC<sub>1-8</sub>alkyl group such as an optionally substituted benzoyloxyethyl or benzoyl-

oxypropyl group. Optional substituents present on the Alk<sup>1</sup> group include R<sup>18</sup> substituents described above.

When Alk is present in or as a substituent R<sup>17</sup> it may be for example a  
5 methylene, ethylene, n-propylene, i-propylene, n-butylene, i-butylene,

The presence of certain substituents in the compounds of formula (1) may enable salts of the compounds to be formed. Suitable salts include pharmaceutically acceptable salts, for example acid addition salts derived from inorganic or organic acids, and salts derived from inorganic and 10 organic bases.

15 Acid addition salts include hydrochlorides, hydrobromides, hydroiodides, alkylsulphonates, e.g. methanesulphonates, ethanesulphonates, or isethionates, arylsulphonates, e.g. p-toluenesulphonates, besylates or napsylates, phosphates, sulphates, hydrogen sulphates, acetates, trifluoroacetates, propionates, citrates, maleates, fumarates, malonates, succinates, lactates, oxalates, tartrates and benzoates.

It is to be understood that the invention extends to all such tautomers and isomers of the compounds of formula (1), and to mixtures thereof, including racemates.

35 In the compounds according to the invention the group R<sup>4</sup> is preferably a group X<sup>1</sup>R<sup>11</sup> in which X<sup>1</sup> is a covalent bond.

The group R<sup>5</sup> in compounds of the invention is in particular a bromine or, especially a chlorine atom.

5 A particularly useful group of compounds according to the invention has the formula (1a):

One particular class of compounds of formulae (1) and (1a) is that wherein one or both of R<sup>2</sup> and R<sup>3</sup> is a hydrogen atom. Compounds in which R<sup>2</sup> and R<sup>3</sup> is each a hydrogen atom are especially useful.

Compounds according to the invention are potent and selective inhibitors  
10 of KDR and/or FGFr4 kinases as demonstrated by differential inhibition of  
these enzymes when compared to inhibition of other protein kinases such  
as EGFr kinase, p56<sup>lck</sup> kinase, ZAP-70 kinase, protein kinase C, Csk  
kinase and p59<sup>fyn</sup> kinase. The ability of the compounds to act in this way  
may be simply determined by employing tests such as those described in  
15 the Examples hereinafter.

The compounds according to the invention are thus of particular use in the  
prophylaxis and treatment of diseases in which inappropriate KDR kinase  
action plays a role, for example in disease states associated with  
20 angiogenesis. The compounds are then of use for example in the  
prophylaxis and treatment of cancer, prosiasis, rheumatoid arthritis,  
Kaposi's Sarcoma, ischemic heart disease, atherosclerosis and ocular  
diseases, such as diabetic retinopathy, involving retinal vessel proliferation  
25 and the invention is to be understood to extend to such uses and to the  
use of a compound of formula (1) in the preparation of a medicament for  
the prophylaxis and treatment of such diseases.

For the prophylaxis or treatment of disease the compounds according to  
the invention may be administered as pharmaceutical compositions, and  
30 according to a further aspect of the invention we provide a pharmaceutical  
composition which comprises a compound of formula (1) together with one  
or more pharmaceutically acceptable carriers, excipients or diluents.

35 Pharmaceutical compositions according to the invention may take a form  
suitable for oral, buccal, parenteral, nasal, topical or rectal administration,  
or a form suitable for administration by inhalation or insufflation.

For oral administration, the pharmaceutical compositions may take the form of, for example, tablets, lozenges or capsules prepared by conventional means with pharmaceutically acceptable excipients such as

- 5 binding agents (e.g. pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g. lactose, microcrystalline cellulose or calcium hydrogen phosphate); lubricants (e.g. magnesium stearate, talc or silica); disintegrants (e.g. potato starch or sodium glycollate); or wetting agents (e.g. sodium lauryl sulphate). The tablets
- 10 may be coated by methods well known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may be prepared by conventional means with pharmaceutically acceptable
- 15 additives such as suspending agents, emulsifying agents, non-aqueous vehicles and preservatives. The preparations may also contain buffer salts, flavouring, colouring and sweetening agents as appropriate.

- 20 Preparations for oral administration may be suitably formulated to give controlled release of the active compound.

For buccal administration the compositions may take the form of tablets or lozenges formulated in conventional manner.

- 25 The compounds for formula (1) may be formulated for parenteral administration by injection, including bolus injection or infusion or particle mediated injection. Formulations for injection may be presented in unit dosage form, e.g. in glass ampoule or multi dose containers, e.g. glass vials or a device containing a compressed gas such as helium for particle mediated administration. The compositions for bolus injection or infusion may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilising, preserving and/or dispersing agents. Alternatively, the active ingredient may be in powder form for constitution
- 30 with a suitable vehicle, e.g. sterile pyrogen-free water, before use. For
- 35

particle mediated administration the complex may be coated on particles such as microscopic gold particles.

In addition to the formulations described above, the compounds of formula 5 (1) may also be formulated as a depot preparation. Such long acting formulations may be administered by implantation or by intramuscular injection. Where desired, the compounds according to the invention may also be conjugated to a polymer, e.g. a naturally occurring polymer such as albumin, to prolong the half life of the compounds when in use. Such 10 conjugates may be formulated and delivered as described above.

For nasal administration or administration by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of an aerosol spray presentation for pressurised packs or a nebuliser, 15 with the use of suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas or mixture of gases.

The compositions may, if desired, be presented in a pack or dispenser 20 device which may contain one or more unit dosage forms containing the active ingredient. The pack or dispensing device may be accompanied by instructions for administration.

The quantity of a compound of the invention required for the prophylaxis or 25 treatment of a particular condition will vary depending on the compound chosen, and the condition of the patient to be treated. In general, however, daily dosages may range from around 100ng/kg to 100mg/kg e.g. around 0.01mg/kg to 40mg/kg body weight for oral or buccal administration, from around 10ng/kg to 50mg/kg body weight for 30 parenteral administration and around 0.05mg to around 1000mg e.g. around 0.5mg to around 1000mg for nasal administration or administration by inhalation or insufflation.

The compounds of the invention may be prepared by a number of 35 processes as generally described below and more specifically in the Examples hereinafter. In the following process description, the symbols

R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and R<sup>5</sup> when used in the text or formulae depicted are to be understood to represent those groups described above in relation to formula (1) unless otherwise indicated. In the reactions described below, it may be necessary to protect reactive functional groups, for example 5 hydroxy, amino, thio or carboxy groups, where these are desired in the final product, to avoid their unwanted participation in the reactions. Conventional protecting groups may be used in accordance with standard 10 practice [see, for example, Green, T. W. in "Protective Groups in Organic Synthesis", John Wiley and Sons, 1991]. In some instances, deprotection 15 may be the final step in the synthesis of a compound of formula (1) and the processes according to the invention described hereinafter are to be understood to extend to such removal of protecting groups.

Thus according to a further aspect of the invention, a compound of formula 15 (1) may be prepared by reaction of a guanidine of formula (2):

20 or a salt thereof  
with an enaminone of formula (3):

25 where R<sup>20</sup> and R<sup>21</sup>, which may be the same or different is each a C<sub>1-6</sub> Alkyl group.

The reaction may be performed in a solvent, for example a protic solvent 30 such as an alcohol, e.g. ethanol, ethoxyethanol or propan-2-ol, optionally in the presence of a base e.g. an Alkali metal base, such as sodium hydroxide or potassium carbonate, at an elevated temperature, e.g. the reflux temperature.

Salts of the compounds of formula (2) include acid salts such as inorganic acid salts e.g. hydrochlorides or nitrates.

5 Intermediate guanidines of formula (2) may be prepared by reaction of the corresponding amine of formula (4):

10 with cyanamide at an elevated temperature. The reaction may be performed in a solvent such as ethanol at an elevated temperature, e.g. up to the reflux temperature. Where it is desired to obtain a salt of a guanidine of formula (2), the reaction may be performed in the presence of a concentrated acid, e.g. hydrochloric or nitric acid.

15 The amines of formula (4) are either known compounds or may be obtained by conventional procedures, for example by hydrogenation of the corresponding nitro derivatives using for example hydrogen in the presence of a metal catalyst in a suitable solvent, for example as more particularly described in the interconversion reactions discussed below.

20 The nitrobenzenes for this particular reaction are either known compounds or may be prepared using similar methods to those used for the preparation of the known compounds.

25 Intermediate enaminones of formula (3) are either known compounds or may be prepared by reaction of an acetyl derivative  $R^4COCH_2R^5$  with an acetal  $(R^{20})(R^{21})NCH(OR^{22})_2$  (where  $R^{22}$  is a C<sub>1-6</sub>Alkyl group such as a methyl or ethyl group) at an elevated temperature. The starting materials for this reaction are either known compounds or may be prepared by methods analogous to those used for the preparation of the known compounds.

In another process according to the invention, a compound of formula (1) may be prepared by displacement of a chlorine atom in a pyrimidine of formula (5):

5 (5)

with an amine of formula (4)

10 The reaction may be performed at an elevated temperature, for example the reflux temperature, where necessary in the presence of a solvent, for example an alcohol, such as 2-ethoxyethanol or isopropanol, a cyclic ether, e.g. dioxane or a substituted amide such as dimethylformamide, optionally in the presence of a base, for example an organic amine such as pyridine.

15 Intermediate pyrimidines of formula (5) may be obtained by reaction of a corresponding pyrimidine of formula (6):

(6)

20 with phosphorous oxychloride optionally in a solvent such as a substituted amide e.g. dimethylformamide at an elevated temperature, for example the reflux temperature.

25 Intermediates of formula (6) may be prepared from the corresponding amine of formula (7):

with sodium nitrite in an aqueous acid, e.g. aqueous sulphuric acid at around ambient temperature.

5

Amines of formula (7) may be prepared by reaction of an enaminone of formula (3) with a guanidine salt, e.g. guanidine carbonate, as described above for the preparation of compounds of formula (1).

10 Compounds of formula (1) may also be prepared by interconversion of other compounds of formula (1) and it is to be understood that the invention extends to such interconversion processes. Thus, for example, standard substitution approaches employing for example Alkylation, arylation, heteroarylation, acylation, thioacetylation, sulphonylation, 15 formylation or coupling reactions may be used to add new substituents to and/or extend existing substituents in compounds of formula (1). Alternatively existing substituents in compounds of formula (1) may be modified by for example oxidation, reduction or cleavage reactions to yield other compounds of formula (1).

20

The following describes in general terms a number of approaches which can be employed to modify existing phenyl and/or other aromatic or heteroaromatic groups in compounds of formula (1). It will be appreciated that each of these reactions will only be possible where an appropriate 25 functional group exists in a compound of formula (1). Where desired, these reactions may also be performed on intermediates to compounds of formula (1).

Thus, for example Alkylation, arylation or heteroarylation of a compound of 30 formula (1) may be achieved by reaction of the compound with a reagent Alk, L or ArL, where Alk is an Alkyl group and Ar is an aryl or heteroaryl

group as defined above in relation to compounds of formula (1) and L is a leaving atom or group such as a halogen atom, e.g. a chlorine or bromine atom, or a sulphonyloxy group, e.g. an arylsulphonyloxy group such as a *p*-toluenesulphonyloxy group.

5

The Alkylation or arylation reaction may be carried out in the presence of a base, e.g. an inorganic base such as a carbonate, e.g. caesium or potassium carbonate, an Alkoxide, e.g. potassium t-butoxide, or a hydride, e.g. sodium hydride, in a dipolar aprotic solvent such as an amide, e.g. a substituted amide such as dimethylformamide or an ether, e.g. a cyclic ether such as tetrahydrofuran, at around 0°C to around 40°C.

In a variation of this process the leaving group L may be alternatively part of the compound of formula (1) and the reaction performed with an appropriate nucleophilic reagent at an elevated temperature. Particular nucleophilic reagents include cyclic amines, such as piperazine. Where appropriate the reaction may be performed in a solvent such as an aprotic solvent, e.g. a substituted amide such as dimethylformamide.

15 20 In another general example of an interconversion process, a compound of formula (1) may be acylated or thioacylated. The reaction may be performed for example with an acyl halide or anhydride in the presence of a base, such as a tertiary amine e.g. triethylamine in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane at for example ambient

25 temperature, or by reaction with a thioester in an inert solvent such as tetrahydrofuran at a low temperature such as around 0°C. The reaction is particularly suitable for use with compounds of formula (1) containing primary or secondary amino groups.

30 35 In a further general example of an interconversion process, a compound of formula (1) may be formylated, for example by reaction of the compound with a mixed anhydride HCOOCOCH<sub>3</sub> or with a mixture of formic acid and acetic anhydride.

35 Compounds of formula (1) may be prepared in another general interconversion reaction by sulphonylation, for example by reaction of the

compound with a reagent  $\text{AlkS(O)}_2\text{L}$ , or  $\text{ArS(O)}_2\text{L}$  in the presence of a base, for example an inorganic base such as sodium hydride in a solvent such as an amide, e.g. a substituted amide such as dimethylformamide at for example ambient temperature. The reaction may in particular be 5 performed with compounds of formula (1) possessing a primary or secondary amino group.

In further examples of interconversion reactions according to the invention 10 compounds of formula (1) may be prepared from other compounds of formula (1) by modification of existing functional groups in the latter.

Thus in one example, ester groups  $-\text{CO}_2\text{Alk}^1$  in compounds of formula (1) 15 may be converted to the corresponding acid  $[-\text{CO}_2\text{H}]$  by acid- or base-catalysed hydrolysis or by catalytic hydrogenation depending on the nature of the group  $\text{Alk}^1$ . Acid- or base-catalysed hydrolysis may be achieved for example by treatment with an organic or inorganic acid, e.g. trifluoroacetic acid in an aqueous solvent or a mineral acid such as hydrochloric acid in a solvent such as dioxan or an Alkali metal hydroxide, e.g. lithium hydroxide in an aqueous alcohol, e.g. aqueous methanol.

20 Catalytic hydrogenation may be carried out using for example hydrogen in the presence of a metal catalyst, for example palladium on a support such as carbon in a solvent such as an ether, e.g. tetrahydrofuran or an alcohol, e.g. methanol.

25 In a second example,  $-\text{OAlk}$  [where  $\text{Alk}$  represents an Alkyl group such as a methyl group] groups in compounds of formula (1) may be cleaved to the corresponding alcohol  $-\text{OH}$  by reaction with boron tribromide in a solvent such as a halogenated hydrocarbon, e.g. dichloromethane at a low temperature, e.g. around  $-78^\circ\text{C}$ .

30 In another example, alcohol  $-\text{OH}$  groups in compounds of formula (1) may be converted to a corresponding  $-\text{OAlk}$  or  $-\text{OAr}$  group by coupling with a reagent  $\text{AlkOH}$  or  $\text{ArOH}$  in a solvent such as tetrahydrofuran in the presence of a phosphine, e.g. triphenylphosphine and an activator such as 35 diethyl-, diisopropyl-, or dimethylazodicarboxylate.

Aminosulphonylamino [-NHSO<sub>2</sub>NH<sub>2</sub>] groups in compounds of formula (1) may be obtained, in another example, by reaction of a corresponding amine [-NH<sub>2</sub>] with sulphamide in the presence of an organic base such as pyridine at an elevated temperature, e.g. the reflux temperature.

5

In another example of an interconversion process secondary amine groups in compounds of formula (1) may be Alkylated using an alcohol, e.g. ethanol and catalytic hydrogenation, employing for example hydrogen in the presence of a metal catalyst such as palladium on a support such as 10 carbon.

In a further example, amine [-NH<sub>2</sub>] groups in compounds of formula (1) may be obtained by hydrolysis from a corresponding imide by reaction with hydrazine in a solvent such as an alcohol, e.g. ethanol at ambient 15 temperature. In an alternative, amine groups may also be generated by reduction of the corresponding nitrile, for example using a reducing agent such as a borohydride, e.g. sodium borohydride or cerium trichloride.

In another example, a nitro [-NO<sub>2</sub>] group may be reduced to an amine [-NH<sub>2</sub>], for example by catalytic hydrogenation as just described, or by 20 chemical reduction using for example a metal, e.g. tin or iron, in the presence of an acid such as hydrochloric acid.

N-oxides of compounds of formula (1) may be prepared for example by 25 oxidation of the corresponding nitrogen base using an oxidising agent such as hydrogen peroxide in the presence of an acid such as acetic acid, at an elevated temperature, for example around 70°C to 80°C, or alternatively by reaction with a peracid such as peracetic acid in a solvent, e.g. dichloromethane, at ambient temperature.

30

Where salts of compounds of formula (1) are desired, these may be prepared by conventional means, for example by reaction of a compound of formula (1) with an appropriate acid or base in a suitable solvent or mixture of solvents, e.g. an organic solvent such as an ether, e.g. 35 diethylether, or an alcohol, e.g. ethanol.

The following Examples illustrate the invention. In the Examples all  $^1\text{H}$ nmr were run at 300MHz unless specified otherwise. All temperatures are in  $^{\circ}\text{C}$ .

10 **EXAMPLE 1**

A mixture of 4-[4-(1-tertbutoxycarbonylamino-1-methylethyl)phenyl]-2,5-dichloropyrimidine (1.53g, 4.0mmol) and 4-aminophenethyl alcohol (1.10g, 8.0mmol) in 2-ethoxyethanol (15ml) was heated to reflux for 18h. The reaction was cooled to room temperature, trifluoroacetic acid (2ml) added and the reaction stirred for 30min. Solvent was removed *in vacuo* and the residue partitioned between  $\text{CH}_2\text{Cl}_2$  (100ml) and saturated, aqueous  $\text{Na}_2\text{CO}_3$  (80ml). The aqueous layer was re-extracted with  $\text{CH}_2\text{Cl}_2$  (2 x 80ml) and the combined  $\text{CH}_2\text{Cl}_2$  layer washed with aqueous  $\text{Na}_2\text{CO}_3$  (80ml), brine (80ml), dried ( $\text{MgSO}_4$ ) and concentrated *in vacuo*. The crude product was purified by column chromatography (silica, 10-15% methanol in  $\text{CH}_2\text{Cl}_2$ ) to give the title compound as a buff solid (1.30g) m.p. 162-163 $^{\circ}$ .  $\delta\text{H}$  ( $d^6\text{DMSO}$ ) 9.74 (1H, s), 8.55 (1H, s), 7.76 (2H, d,  $\downarrow$  8.5Hz), 7.68 (2H, d,  $\downarrow$  8.5Hz), 7.62 (2H, d,  $\downarrow$  8.5Hz), 7.12 (2H, d,  $\downarrow$  8.5Hz), 4.57 (1H, bs), 3.55 (2H, m), 2.65 (2H, t,  $\downarrow$  7.2Hz), 1.41 (6H, s); MS (ESI) 383 ( $\text{M}^+$ ,  $^{35}\text{Cl}$ , 100%).

The 4-[4-(1-tertbutoxycarbonylamino-1-methylethyl)phenyl]-2,5-dichloropyrimidine used in the above process was prepared as follows:-

30 Cerium trichloride heptahydrate (22.47g, 60mmol) was dried in a flask under high vacuum (0.08 Torr) heated by an oil bath at 140-160 $^{\circ}$  for 4h. On cooling, nitrogen was introduced slowly into the flask and anhydrous THF (120ml) added to give a suspension of  $\text{CeCl}_3$  which was stirred for 16h at room temperature. The mixture was cooled to -65 $^{\circ}$ , methyl lithium (37.5ml of a 1.6M solution in diethylether, 60mmol) added dropwise and the mixture stirred for 0.5h. A solution of 4-bromobenzonitrile (3.64g,

20mmol) in THF (10ml) was added and the reaction stirred at -65° for 3.5h before allowing the mixture to warm to -40°. The reaction was quenched by the addition of 33% ammonium hydroxide (50ml) and then allowed to warm to room temperature. The resulting solids were removed by filtration

5 through a pad of Celite® and were washed with ethyl acetate (3 x 100ml). The combined filtrates were washed with brine (20ml), the organic phase dried (MgSO<sub>4</sub>) and concentrated *in vacuo* to give 1-(4-bromophenyl)-1-methylethylamine as a yellow oil (4.01g). This product was heated at reflux in toluene (40ml) with di-tert-butyl dicarbonate (4.50g, 20.6mmol) for

10 1h. Solvent was removed *in vacuo* and the crude product recrystallised from hexane at -20° to give tertbutyl N-{1-(4-bromophenyl)-1-methylethyl}carbamate as colourless crystals (3.47g) m.p. 92-93° δH (CDCl<sub>3</sub>) 7.43 (2H, dt, J 8.7, 2.7Hz), 7.26 (2H, dt, J 8.8, 2.6Hz), 4.91 (1H, bs), 1.59 (6H, s), 1.36 (9H, bs).

The reaction was then

20 concentrated under reduced pressure, the resulting residue taken up in dichloromethane (80ml) and washed with water (1 x 80ml), then brine (1 x 80ml), dried (MgSO<sub>4</sub>) and again concentrated. The residue was subjected to column chromatography (silica gel; 15% ethyl acetate-hexane) to give tert-butyl N-{1-[4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]-1-methylethyl}carbamate (1.55g) as a white solid m.p. 140°. δH (CDCl<sub>3</sub>) 7.77 (2H, d, J 8.3Hz), 7.40 (2H, d, J 8.4Hz), 1.63 (6H, s) and 1.34 (21H, s).

25 2M aqueous Na<sub>2</sub>CO<sub>3</sub> (4.7ml, 9.4mmol) was added to a solution of 2,4,5-trichloropyrimidine [Chesterfield, J.; McOmie, J. F. W.; Sayer, E. R.; J. Chem. Soc. (1955) 3478-3481] (1.18g, 6.44mmol), tert-butyl N-{1-[4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]1-methylethyl}carbamate (1.55g, 4.29mmol) and tetrakis(triphenylphosphine)palladium (O) (150mg, 0.13mmol) in ethyleneglycol dimethylether (20ml) under N<sub>2</sub> and the mixture heated to reflux for 6h. The reaction was diluted with H<sub>2</sub>O (30ml) and extracted with ethyl acetate (3 x 50ml), the combined ethyl acetate extracts were washed with brine (30ml), dried (MgSO<sub>4</sub>) and

concentrated *in vacuo*. The crude product was purified by column chromatography (SiO<sub>2</sub>, 15% ethyl acetate in hexane) to give 4-[4-(1-tert-butoxycarbonylamino-1-methylethyl)phenyl]-2,5-dichloropyrimidine as a white solid (1.34g).  $\delta$ H (d<sup>6</sup>DMSO) 8.62 (1H, s), 7.90 (2H, d,  $\downarrow$  8.6Hz), 7.54 (2H, dt,  $\downarrow$  8.7, 2.1Hz), 5.02 (1H, bs), 1.65 (6H, s) and 1.37 (9H, s).

**BIOLOGICAL ACTIVITY**

30 The following assays were used to demonstrate the activity and selectivity of compounds according to the invention:

The activity of the compounds against KDR kinase and FGFR2 kinase can be determined in the following two assays:

**KDR Kinase and FGFr2 Kinase**

The activities of recombinant KDR kinase and FGFr2 kinase were determined by measuring their ability to transfer the  $\gamma$ -phosphate from [ $^{33}$ P]ATP to polyglutamic acid - tyrosine (pEY).

5

The assay methodology employed for both kinases is identical except that in the assay of KDR kinase the diluent used throughout was 20mM HEPES pH 7.25 containing 2mM MnCl<sub>2</sub>, 2mM MnCl<sub>2</sub>, 5mM DTT and 0.05% Brij 35, whereas in the FGFr2 assay 10mM MnCl<sub>2</sub> is used instead 10 of 2mM MnCl<sub>2</sub> and 2mM MnCl<sub>2</sub>.

The assay was conducted in a total volume of 202 $\mu$ l containing 1-10ng kinase, 5 $\mu$ g/ml pEY (4:1) (Sigma, UK), 1 $\mu$ M ATP (containing ~50,000cpm [ $^{33}$ P]ATP (Amersham International, UK) (Sigma, UK) and test inhibitors at 15 the appropriate concentration. The test inhibitors were dissolved in DMSO and added such that the final concentration of DMSO in the assay did not exceed 2% (v/v). The assay was initiated by addition of kinase and terminated after 10 minutes incubation at room temperature by addition of 50 $\mu$ l of 20mM HEPES pH 7.25 containing 0.125M EDTA and 10mM ATP. 20 A 200 $\mu$ l aliquot was applied to the well of a Millipore (UK) MAFC filter plate containing 100 $\mu$ l of 30% (w/v) trichloroacetic acid (TCA). The plate was then placed on a suitable manifold and connected to a vacuum. After complete elimination of the liquid each well was washed under vacuum using five volumes (100 $\mu$ l per wash) of 10% (w/v) TCA and finally two 25 volumes (100 $\mu$ l per wash) of ethanol. The bottom of the filter plate was then sealed and 100 $\mu$ l per well of Ultima Gold (Beckham, UK) scintillant was added to each well. The radioactivity was measured using an appropriate scintillation counter such as a Wallac Trilux or Packard TopCount. The IC<sub>50</sub> value for each inhibitor was obtained from log dose 30 inhibition curves fitted to the four-parameters logistic equation.

In this assay the most active compounds according to the invention have IC<sub>50</sub> values of around 1 $\mu$ M and below.

35 The selectivity of compounds according to the invention can be determined in the following assays:

p56<sup>lck</sup> kinase assay

5 The tyrosine kinase activity of p56<sup>lck</sup> was determined using a RR-src peptide (RRLIEDNEYTARG) and [ $\gamma$ -<sup>33</sup>P]ATP as substrates. Quantitation of the <sup>33</sup>P-phosphorylated peptide formed by the action of p56<sup>lck</sup> was achieved using an adaption of the method of Geissler *et al* (J. Biol. Chem. (1990) 265, 22255-22261).

10 All assays were performed in 20mM HEPES pH 7.5 containing 10mM MgCl<sub>2</sub>, 10mM MnCl<sub>2</sub>, 0.05% Brij, 1 $\mu$ M ATP (0.5 $\mu$ Ci[ $\gamma$ -<sup>33</sup>P]ATP) and 0.8mg/ml RR-src. Inhibitors in dimethylsulphoxide (DMSO) were added such that the final concentration of DMSO did not exceed 1%, and enzyme such that the consumption of ATP was less than 10%. After incubation at 15 30°C for 15min, the reaction was terminated by the addition of one-third volume of stop reagent (0.25mM EDTA and 33mM ATP in dH<sub>2</sub>O). A 15 $\mu$ l aliquot was removed, spotted onto a P-30 filtermat (Wallac, Milton Keynes, UK), and washed sequentially with 1% acetic acid and de-ionised water to remove ATP. The bound <sup>33</sup>P-RR-src was quantitated by scintillation counting of the filtermat in a Betaplate scintillation counter (Wallac, Milton 20 Keynes, UK) after addition of Meltilex scintillant (Wallac, Milton Keynes, UK).

25 The dpm obtained, being directly proportional to the amount of <sup>33</sup>P-RR-src produced by p56<sup>lck</sup>, were used to determine the IC<sub>50</sub> for each compound. The IC<sub>50</sub> was defined as the concentration of compound required to reduce the production of <sup>33</sup>P-RR-src by 50%.

30 In this test, compounds according to the invention have IC<sub>50</sub> values of 10 $\mu$ M and above.

30

Zap-70 kinase assay

35 The tyrosine kinase activity of Zap-70 was determined using a capture assay based on that employed above for p56<sup>lck</sup>. The RR-src peptide was replaced with polyGlu-Tyr (Sigma; Poole, UK) at a final concentration of 17  $\mu$ g/ml. After addition of the stopped reaction to the filtermat, trichloroacetic acid 10% (w/v) was employed as the wash reagent instead of acetic acid

and a final wash in absolute ethanol was also performed before scintillation counting. IC<sub>50</sub> values were determined as described above in the p56<sup>lck</sup> assay.

5 In this test the compounds of the invention have IC<sub>50</sub> values of around 10μM and above.

**EGFr kinase assay**

10 The tyrosine kinase activity of the EGF receptor (EGFr) was determined using a similar methodology to the p56<sup>lck</sup> kinase assay, except that the RR-src peptide was replaced by a peptide substrate for EGFr obtained from Amersham International plc (Little Chalfont, UK) and used at the manufacturer's recommended concentration. IC<sub>50</sub> values were determined as described previously in the p56<sup>lck</sup> assay.

15

**Protein kinase C assay**

20 Inhibitor activity against protein kinase C (PKC) was determined using PKC obtained from Sigma Chemical Company (Poole, UK) and a commercially available assay system (Amersham International plc, Amersham, UK). Briefly, PKC catalyses the transfer of the γ-phosphate (32p) of ATP to the threonine group on a peptide specific for PKC. Phosphorylated peptide is bound to phosphocellulose paper and subsequently quantified by scintillation counting. The inhibitor potency is expressed as either (i) the concentration required to inhibit 50% of the 25 enzyme activity (IC<sub>50</sub>) or (ii) the percentage inhibition achieved by 10μM inhibitor.

In this test the compounds of the invention have IC<sub>50</sub> values of around 10μM and above.
